

DATABASE MANAGEMENT SYSTEM REPORT

System Title

Supermarket Retail and Supply Chain Management System

Objective of the System

The system was developed to manage suppliers, products, customers, orders, payments, inventory, employees, jobs, and store operations using a centralized relational database system.

The database improves:

Inventory tracking
Customer order management
Payment processing
Supplier coordination
Employee and store management

This report demonstrates:

- Database creation
- Table design & relationships
- Data insertion
- Query execution

Tables Created

Table	Purpose
Supplier	Stores supplier details (name, contact, phone, address).
Product	Holds product info (name, category, price, stock, supplier link)
Customer	Customer details (name, phone, email, address)
Orders	Records customer orders (date, amount, customer link).
OrderItems	Items within each order (product, quantity, price)
Payment	Payment details (amount, date, method, linked to order)
Store	Branch information (name, location).
Inventory	Stock levels per store (product-store relationship)
Job	Job titles and salaries
Employee	Employee details linked to jobs and stores.

Relationships Used

Supplier → **Product**: Each product is supplied by a supplier.

Customer → **Orders**: Each order belongs to a customer.

Orders → **OrderItems**: Each order contains multiple items.

Orders → **Payment**: Each order has payment records.

Store → **Inventory**: Each store manages product stock.

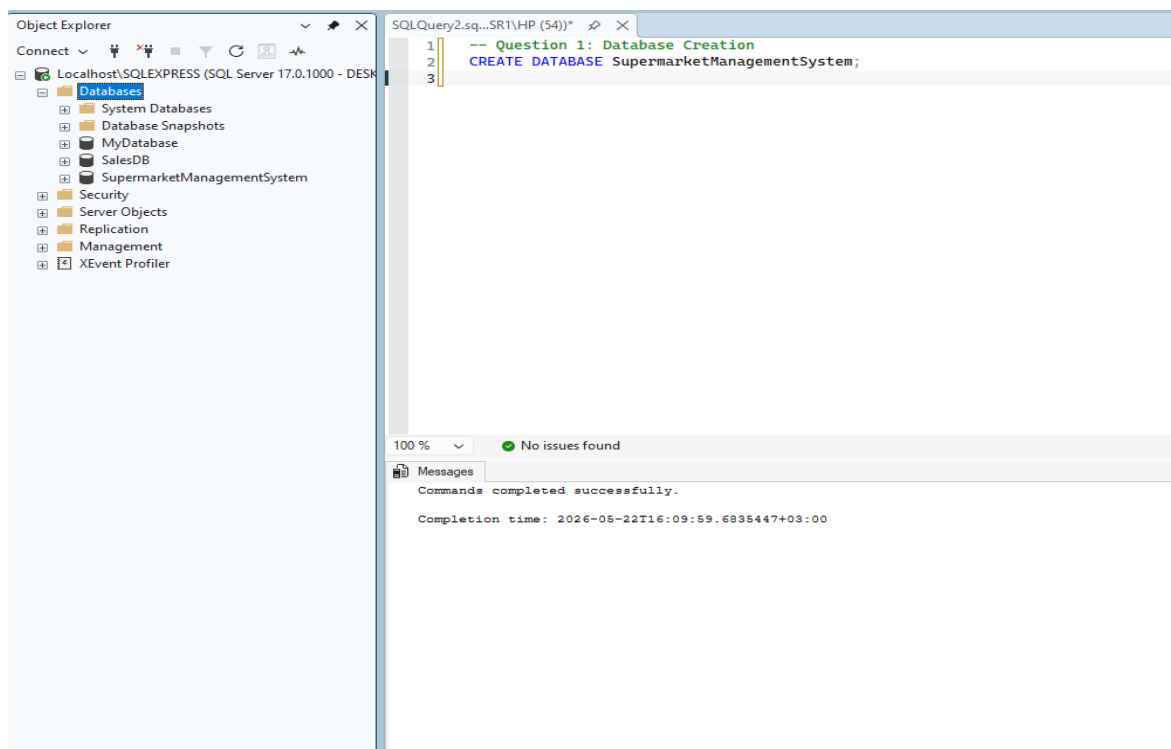

Job → **Employee**: Each employee is assigned a job.

Store → **Employee**: Employees are linked to specific stores.

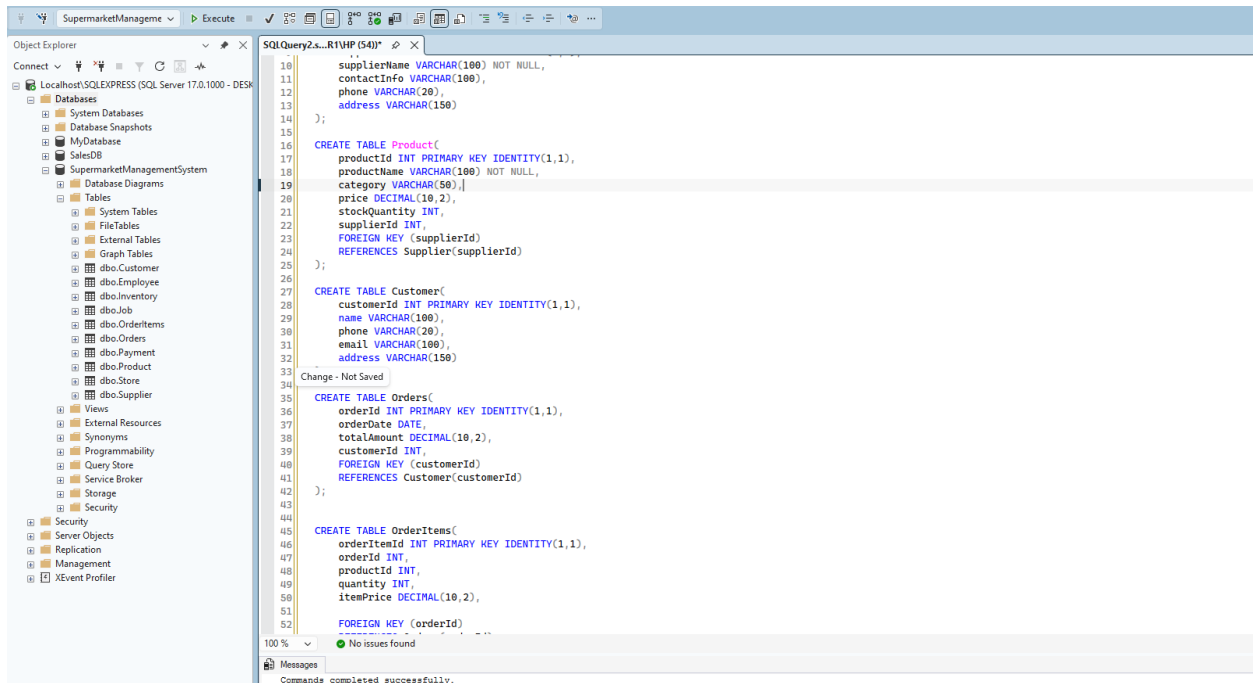

These are implemented using **foreign keys**

Conclusion

The database system was successfully designed and implemented using SQL Server. The system supports retail and supply chain management operations such as supplier management, inventory tracking, customer orders, payments, and employee management. Relationships between tables were implemented using primary and foreign keys to ensure data integrity and consistency.
